## The circulatory System.

The heart, the blood and the blood vessels make up the circulatory system. The heart pumps the blood to different parts of the body through small and big blood vessels.

## Oral Questions.

Choose the correct answer:

Cells of the same kind join together to make (a tissue / an organ):

The sense organs send (letters / messages / cards) to the brain.

The undigested food goes to the (small intestine / large intestine).

## The nervous system.

This system consists of the brain, the spinal cord and the nerves.

The nervous system controls all our actions like seeing, hearing, walking and learning.

## The Skeletal system.

Our body is made up of 206 bones.

These bones together make up the skeletal system. The bones give shape and support to the body. We can stand, walk and move because of our bones.

The muscular System  
Our muscles along with the bones help the body and its parts to move.

The excretory system.

The waste in the body has to be removed regularly for the body to work smoothly.

This is done by the organs of the excretory system. The kidneys remove urine. The skin removes sweat. The lungs throw out carbon dioxide.

The reproductive system.

The organs of this system help to produce babies. Because of this system life on earth goes on.
